

## Primobolan

Also known as **Methenolone** and **Primo**, **Primobolan** is one of the most popular oral and **injectable anabolic steroids** and **performance enhancing drugs**. The fact that this non-17-alkylate steroid is not toxic to the liver and highly effective in enhancing performance and body strength means that sportsmen and others using it can expect dramatic results without any second thought. Primobolan has the chemical name of 17 $\beta$ -hydroxy-1-methyl-5 $\alpha$ -androst-1-en-3-one acetate and its anabolic/androgenic ratio is 88:44-57. The molecular weight of Primobolan is 344.488 g/mol at the base and its molecular formula is C<sub>22</sub>H<sub>32</sub>O<sub>3</sub>. The active life of oral Primobolan is 4-6 hours and active life of liquid (injectable) Primobolan is 10-14 days. This steroid can be detected over a period of 4-5 weeks and its anabolic/androgenic ratio is 88:44-57. It is available both as an injectable (enanthate) and oral (acetate). The steroid is a long acting anabolic with mild anabolic effects and extremely low androgenic properties. Its potency is considered slightly lower than Deca Durabolin, on a milligram for milligram basis. The injectable version of **Primo** has a long ester attached to it, which facilitates slow absorption of the active Methenolone compound while offering steady blood concentrations. The steroid is best used during a cutting cycle (in oral or injectable form) for maintaining muscles while the users are on a low-calorie diet. This dihydrotestosterone (DHT) based **anabolic steroid** is mostly admired by people who are very susceptible to side effects of estrogens such as oily skin, acne, gynecomastia, and bloating. The steroid is not 17-alpha-alkylated but 1-methylated for oral bioavailability and is considered to be one of the safest anabolic steroids. This steroid is commonly used between anabolic steroid cycles during "off-time" for maintaining muscle mass and body strength gains.

Since this rare androgen-based steroid is a mild steroid, it can be used by women as well as beginners. The use of Primo, even at high doses, does not lead to formation of excess estrogens and the steroid is medically recommended to reduce breast tumors. The **anabolic steroid** is also advised to HIV/AIDS patients as it has the potential of enhancing immunity of the body to a significant extent. Sportsmen, especially those into body building and weight-related sports, use it for gaining and maintaining lean tissue. The drug causes less inhibition than Testosterone or Deca Durabolin in the context of anabolic effects, due to lack of conversion to DHT, low CNS activity, and lack of aromatization to estrogen. Moreover, **Primo** is not metabolically deactivated by 5 $\alpha$ -reductase. One of the biggest advantages associated with **use of Primo** is that it does not lead to aromatization like other performance improving drugs. Moreover, the **anabolic steroid** is one of the best drugs to reduce female estrogen and androgenic DHT levels. In addition to this, **Primo use** is also associated with significant improvements in terms of active and total testosterone by promoting sex hormone-binding globulin (SHBG) and luteinizing hormone (LH). Furthermore, gains made with **Methenolone** are smooth and nearly permanent rather than fast but short-term in nature.

Since use of Methenolone is not related to interferences in the context of endogenous testosterone as much as injectable nandrolone or testosterone, sportsmen admiring it can be relieved of estrogenic side effects like oily skin, acne, and gynecomastia as the steroid is not converted into estrogen and is low in androgens. Moreover, this steroid is extremely potent in nature and can be easily purchased online with just a few clicks using secured payment options like VISA and MasterCard debit and credit cards. Well-known for its comparative safety and low incidence of side effects, Primobolan is best admired for its potential of helping users preserve muscle mass while losing body fat.

Usually, the **recommended dose of legal Primobolan** is 200-400 mg/week for men and 50-100 mg/week for women and the dosages can be taken with or without meals. The ideal dose of Primo tablets for men is 50-100 mg every day and 10-25 mg every day for women while the dose of injectable Primo is 350-650 mg every week for men and 100 mg every week for women. The **anabolic steroid** is commonly stacked with Deca Durabolin, Testosterone, Dianabol, Clenbuterol, T3, and Anadrol and is also used

by some sportsmen with Sustanon 250 for bulking cycles though most sportsmen use Primo for **cutting cycles**.

The drug is not recommended to those suffering from health complications such as testicular atrophy, testicular cancer, prostate cancer, breast cancer, liver damage, kidney damage, stroke, high blood pressure, and respiratory problems. It is also not suggested to pregnant and lactating women or women who may get pregnant while using Primo. The steroid is also not suggested to children or those having an existing allergy to Primobolan or any of its active or inactive ingredients. Individuals making use of drugs such as Prasterone, Tamoxifen, DHEA, and Androstenedione should avoid using Primobolan unless the same is specifically approved by a qualified medical practitioner. Furthermore, two dosages of the drug cannot be taken together at the same time, even if the first dose was missed accidentally. In case the first dose was missed, it should be skipped and the next dosage should be taken at the scheduled time.

In order to ensure that you do not **abuse Primobolan**, it is best to buy it after getting a medical prescription (after complete evaluation of medical reports and history) and the purchase should always be made from a reputed steroid store or pharmacy.

**Primobolan** must be stored at a controlled room temperature of 20° to 25°C (68° to 77°F) with excursions permitted to 15° to 30°C (59° to 86°F) and kept away from unauthorized use, pets, sunlight, moisture, and children. In case of expired Primobolan tablets or if the tablets or injections are not to be used any more, the same should be discarded after having a word with a pharmacist or local waste disposal company on how to safely discard Primobolan. It is highly recommended that **Primobolan** should not be flushed down the toilet or poured into a drain, unless specifically recommended by a qualified authority. **Primobolan tablets** or injections should be properly discarded when it is expired or no longer needed.
