

What is Trenbolone Hexahydrobenzylcarbonate Parabolan?

Trenbolone is one of the most potent anabolic steroids available and was originally created to bulk up cattle before being slaughtered. One French scientist caught on to the powerful anabolic properties of Trenbolone and formulated a human grade version called Trenbolone Hexahydrobenzylcarbonate Parabolan. Parabolan was discontinued in 1997, although other injectable forms of this steroid are commercially available.

Trenbolone Hexahydrobenzylcarbonate Parabolan is so highly coveted by bodybuilders because it's considered to be the strongest of anabolic hormones available, with an androgenic score of 500/500. Androgenic scores are used to assess how effective any given steroid's muscle and strength building properties are, using testosterone (100/100) as reference. This means that Parabolan is 5 times as potent as testosterone. [Buy Trenbolone online here.](#)

TBAL75 (Trenbolone)

★★★★★ 5 Review(s)

90
CAPS

EFFECTIVE FOR:

BULKING CYCLE

STRENGTH

CONDITIONING

NOT EFFECTIVE FOR:

FEMALES

7.7
RATING

More potent than testosterone itself, the androgenic effects of Trenbolone lead to huge muscle gains. Red blood cell production is increased, providing more oxygen to your muscles during your workouts, giving you awesome strength and power. TBAL75 is a legal alternative that does not require a prescription... [READ MORE](#)

Trenbolone Hexahydrobenzylcarbonate Parabolan

Trenbolone Parabolan provides its users with many benefits that compound to produce amazing results. One of the benefits is increased nitrogen retention in the muscles. High nitrogen retention is associated with increased muscle mass and decreased catabolic states. In addition, Parabolan increases the amount of red blood cells in your bloodstream. This directly allows you to exercise longer without fatiguing, enabling you to push through that extra set.

Perhaps the most amazing of Trenbolone Hexahydrobenzylcarbonate Parabolan's effects is its ability to greatly increase the amount of nutrients you obtain from your food. This is the main reason why Trenbolone was administered to cattle. With Trenbolone, every gram of protein and carbohydrate goes much farther towards helping its users meet their fitness goals.

Trenbolone Hexahydrobenzylcarbonate Parabolan Cycle

A properly executed Trenbolone cycle is hard to beat in terms of performance enhancement and muscular gains. Parabolan is a very versatile hormone and can be used for bodybuilding or dieting without losing efficacy. Tren can be stacked with several other steroids, such as Winstrol for a synergistic effect. Testosterone and Selective estrogen receptor modulators (SERMs) must be taken with each Trenbolone cycle to prevent nasty side effects, independent of your desired gains.

[CLICK HERE TO SEE TRENBOLONE REVIEWS](#)

Your typical Trenbolone Hexahydrobenzylcarbonate cycle will last anywhere from 8-12 weeks. Each and every Trenbolone cycle must be followed by post-cycle therapy (PCT). PCT is necessary because it helps repair any damage incurred during the Parabolan cycles. Failure to include PCT will result in loss of the gains you made during the cycle and can even permanently shut down your androgen production system.

Whether you're bulking or cutting, most users start their cycles by taking Trenbolone Hexahydrobenzylcarbonate Parabolan every week. Experienced users can be seen injecting

Trenbolone each day, but this is a different form called Trenbolone Acetate and this is not recommended for most athletes. A fast acting oral steroid, such as Dianabol, is usually taken in congruence with Trenbolone and Testosterone.

Parabolan Dosage

Parabolan has a half-life of 8-10 days, the longest out of the Trenbolone derivatives. Dosage is dependent on your previous experience with anabolic steroids and desired results. For health's sake, the recommended amount of Trenbolone Hexahydrobenzylcarbonate Parabolan dosage is no more than 400mg once per week for 8-12 weeks.

Some users delve into dangerous territory by taking more than that. These high doses don't provide enough results to justify the added physical stress and risk of hormonal damage. [Check out](#)

Tren Hexahydrobenzylcarbonate VS Tren Acetate

Trenbolone Acetate holds the title of being the most commonly used injectable derivative of Trenbolone. This is mainly because Trenbolone Acetate is the easiest obtainable form of the drug. In truth, Parabolan is nearly identical to the Acetate version in all ways but one: Trenbolone Hexahydrobenzylcarbonate Parabolan has an ester group attached to it.

The extra ester allows for a much slower release of the hormone into the bloodstream, thereby increasing its half-life and requiring fewer injections to see the same results. For this reason Parabolan is a lot better but not as popular because it's harder to find.

Trenbolone Hexahydrobenzylcarbonate VS Enanthate

Next up on the Trenbolone derivative popularity charts is Trenbolone Enanthate. The Enanthate version of this hormone is strangely not as effective as the Parabolan version in spite of its popularity. This is likely because the name is reminiscent of the popular hormone Testosterone Enanthate. Trenbolone Enanthate carries a longer ester group than Parabolan and needs to only be injected weekly. Many users are doing themselves a disservice by opting for the Enanthate version merely because of an appealing name.

Potential Side Effects

A steroid as powerful and effective as Trenbolone does not come without a catch. It's true that all steroids can harm your body, however, Trenbolone Hexahydrobenzylcarbonate side effects can be particularly nasty if left unchecked. The good news is that all side effects produced by Trenbolone Hexahydrobenzylcarbonate Parabolan are manageable and even preventable. All you have to do is be familiar with the risks and take precautions. Possible side effects include

- *Excess Estrogen:* Any compound said to aromatize means that it converts into estrogen. Estrogen can be thought of as the antithesis of testosterone. Excess estrogen is associated with man-boobs and acne. Trenbolone Hexahydrobenzylcarbonate Parabolan doesn't aromatize, ergo many bodybuilders think they are safe from gynecomastia. What many don't realize during their wiki research is that Trenbolone is progestin based, a hormone that directly stimulates estrogen production in mammary tissue. Selective estrogen receptor modulators (SERMs) can prevent this entirely.
- *High blood pressure:* The only steroid users who experience issues with their blood pressure on a Parabolan cycle are those who already had a blood pressure condition. Additionally, users can develop hypertension if their diet is anything less than healthy.

[CLICK HERE TO BUY TRENBOLONE ONLINE](#)

- *Androgen Suppression:* All anabolic steroids are compared to testosterone on the androgenic scale because all steroids were derived from testosterone. The fallout from this is that when you supplement with steroids your body believes it's producing more testosterone than it actually is. This causes your testosterone production to shut down due to a feedback loop. Low testosterone levels are associated with a decreased libido, hair loss, and even shrunken testes. Exogenous testosterone, such as Testosterone Enanthate, should be taken to avoid this suppression.

If you're ready to take your gains to the next level, you can't go wrong with a Trenbolone Hexahydrobenzylcarbonate Parabolan cycle. Taking the right precautions will provide you be safe with sure-fire results.
